Motivation

Proton spin sum rule: $S_q + L_q + S_G + L_G = \frac{1}{2}$ (Jaffe, Manohar) 10.1016/0550

$$S_q(Q^2) = \frac{1}{2}\int_0^1 \mathrm{d}x \Delta\Sigma(x, Q^2)$$

$$S_q(Q^2 = 10\,\mathrm{GeV}^2) \approx 0.15 \div 0.20$$

for

$$x \in [0.001, 0.7]$$

$$S_G(Q^2) = \int_0^1 \mathrm{d}x \Delta G(x, Q^2)$$

$$S_G(Q^2 = 10\,\mathrm{GeV}^2) \approx 0.13 \div 0.26$$

for

$$x \in [0.05, 0.7]$$

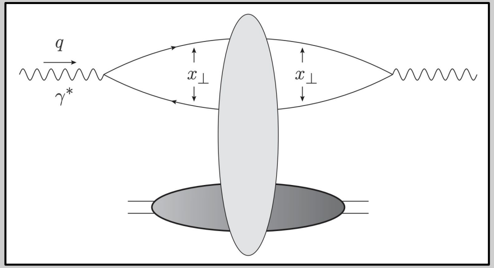
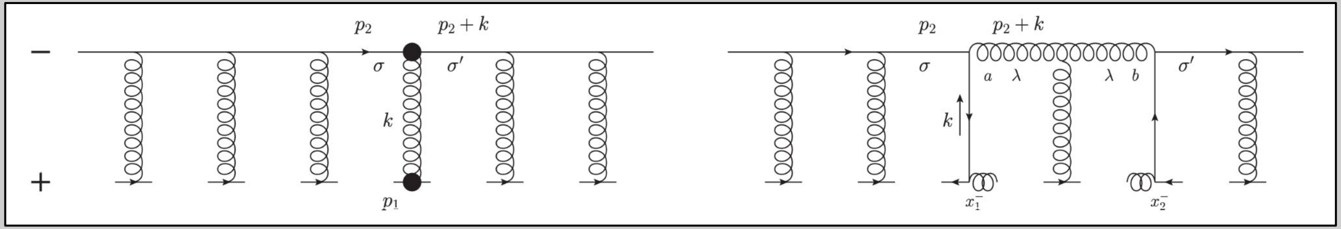
Quark and gluon helicity evolution at small-*x*

Dipole picture of DIS



Helicity evolution enters at the sub-eikonal level



g_1 structure function expressed in terms of the 'polarized dipole amplitudes'

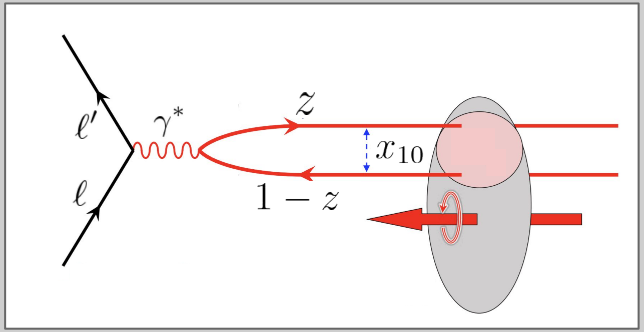
$$G(x_{10}^2, zs),\; G_2(x_{10}^2, zs)$$

$$g_1(x, Q^2) = -\sum_f \frac{N_c Z_f^2}{4\pi^3} \int\limits_{\Lambda^2/s}^{1} \frac{\mathrm{d}z}{z} \int\limits_{\frac{1}{zs}}^{\min\{\frac{1}{zQ^2}, \frac{1}{\Lambda^2}\}} \frac{\mathrm{d}x_{10}^2}{x_{10}^2} \left[G\left(x_{10}^2, zs\right) + 2G_2\left(x_{10}^2, zs\right)\right]$$

Polarized Dipole Amplitudes

$$G_{10}(zs) = \frac{1}{2N_c}\mathrm{Re}\left\langle\left\langle \mathrm{T}\,\mathrm{tr}\left[V_{\underline{0}}V_{\underline{1}}^{G[1]\dagger}\right] + \mathrm{T}\,\mathrm{tr}\left[V_{\underline{1}}^{G[1]}V_{\underline{0}}^{\dagger}\right]\right\rangle\right\rangle(zs)$$

$$G_{10}^{i}(zs) = \frac{1}{2N_c}\left\langle\left\langle \mathrm{tr}\left[V_{\underline{0}}^{\dagger}V_{\underline{1}}^{iG[2]} + \left(V_{\underline{1}}^{iG[2]}\right)^{\dagger}V_{\underline{0}}\right]\right\rangle\right\rangle(zs)$$



$$\int d^2\left(\frac{x_0+x_1}{2}\right)G_{10}(zs) = \underline{G(x_{10}^2, zs)}$$

$$\int d^2\left(\frac{x_0+x_1}{2}\right)G_{10}^{i}(zs) = (x_{10})_{\perp}^{i}G_1(x_{10}^2, zs) + \epsilon^{ij}(x_{10})_{\perp}^{j}\underline{G_2(x_{10}^2, zs)}$$

$V_{\underline{0}}$ is ordinary (unpolarized) fundamental Wilson line

$$V_{\underline{x}} = \mathcal{P}\exp\left[ig\int_{-\infty}^{\infty}dx^{-}A^{+}\left(0^{+}, x^{-}, \underline{x}\right)\right]$$

$V_{\underline{1}}^{G[1]}$, $V_{\underline{1}}^{iG[2]}$ are polarized Wilson line operators

Γ and Γ_2 are auxiliary functions ('neighbor dipole amplitudes')

Would like to solve these equations analytically

Solution

$$G_2(x_{10}^2, zs) = \int \frac{\mathrm{d}\omega}{2\pi i} \int \frac{\mathrm{d}\gamma}{2\pi i} e^{\omega \ln(zs x_{10}^2) + \gamma \ln\left(\frac{1}{x_{10}^2 \Lambda^2}\right)} G_{2\omega\gamma}$$

$$G(x_{10}^2, zs) = \int \frac{\mathrm{d}\omega}{2\pi i} \int \frac{\mathrm{d}\gamma}{2\pi i} e^{\omega \ln(zs x_{10}^2) + \gamma \ln\left(\frac{1}{x_{10}^2 \Lambda^2}\right)} G_{\omega\gamma}$$

Starting point - double inverse Laplace transforms for dipole amplitudes G_2 and G (along with corresponding transforms for the initial conditions of the evolution)

Can then manipulate the large-N_c equations to find expressions for the neighbor dipole amplitudes and constrain the double-Laplace images $G_{2\omega\gamma}$, $G_{\omega\gamma}$

After some work, the results are…

Solution

$$G_2(x_{10}^2, zs) = \int \frac{\mathrm{d}\omega}{2\pi i} \int \frac{\mathrm{d}\gamma}{2\pi i} e^{\omega \ln(zsx_{10}^2) + \gamma \ln\left(\frac{1}{x_{10}^2\Lambda^2}\right)} G_{2\omega\gamma}$$

$$\overline{\alpha}_s = \frac{\alpha_s N_c}{2\pi}$$

$$G(x_{10}^2, zs) = \int \frac{\mathrm{d}\omega}{2\pi i} \int \frac{\mathrm{d}\gamma}{2\pi i} e^{\omega \ln(zsx_{10}^2) + \gamma \ln\left(\frac{1}{x_{10}^2\Lambda^2}\right)} \left[\frac{\omega\gamma}{2\overline{\alpha}_s}\left(G_{2\omega\gamma} - G_{2\omega\gamma}^{(0)}\right) - 2G_{2\omega\gamma}\right]$$

$$G_{2\omega\gamma} = G_{2\omega\gamma}^{(0)} + \frac{\overline{\alpha}_s}{\omega\left(\gamma - \gamma_\omega^-\right)\left(\gamma - \gamma_\omega^+\right)}\left[2\left(\gamma - \delta_\omega^+\right)\left(G_{\delta_\omega^+\gamma}^{(0)} + 2G_{2\delta_\omega^+\gamma}^{(0)}\right) - 2\left(\gamma_\omega^+ - \delta_\omega^+\right)\left(G_{\delta_\omega^+\gamma_\omega^+}^{(0)} + 2G_{2\delta_\omega^+\gamma_\omega^+}^{(0)}\right) + 8\delta_\omega^-\left(G_{2\omega\gamma}^{(0)} - G_{2\omega\gamma_\omega^+}^{(0)}\right)\right]$$

$$\delta_\omega^\pm = \frac{\omega}{2}\left[1 \pm \sqrt{1 - \frac{4\overline{\alpha}_s}{\omega^2}}\right] \qquad \gamma_\omega^\pm = \frac{\omega}{2}\left[1 \pm \sqrt{1 - \frac{16\overline{\alpha}_s}{\omega^2}\sqrt{1 - \frac{4\overline{\alpha}_s}{\omega^2}}}\right]$$

Note $G_{2\omega\gamma}^{(0)}$, $G_{\omega\gamma}^{(0)}$ are the double-Laplace images of the initial conditions $G_2^{(0)}(x_{10}^2, zs)$, $G^{(0)}(x_{10}^2, zs)$

Using the Dipole Amplitudes

Can write down small-*x* large-N_c expressions for hTMDs and hPDFs (for arbitrary initial conditions)

Γ functions, not neighbor dipole amplitude

$$g_{1L}^{G\,dip}(x,k_T^2) = \frac{2N_c}{\alpha_s \pi^3}\frac{1}{k_T^2}\int\frac{d\omega}{2\pi i}\int\frac{d\gamma}{2\pi i}e^{\omega\ln\left(\frac{Q^2}{xk_T^2}\right)+\gamma\ln\left(\frac{k_T^2}{\Lambda^2}\right)}2^{2\omega-2\gamma}\frac{\Gamma(\omega-\gamma+1)}{\Gamma(\gamma-\omega)}G_{2\omega\gamma}$$

$$g_{1L}^{S}(x,k_T^2) = -\frac{N_f}{\alpha_s 2\pi^3}\frac{1}{k_T^2}\int\frac{d\omega}{2\pi i}\int\frac{d\gamma}{2\pi i}\left[e^{\omega\ln\left(\frac{Q^2}{xk_T^2}\right)+\gamma\ln\left(\frac{k_T^2}{\Lambda^2}\right)}-e^{(\gamma-\omega)\ln\left(\frac{k_T^2}{\Lambda^2}\right)}\right]2^{2\omega-2\gamma}\frac{\Gamma(\omega-\gamma+1)}{\Gamma(\gamma-\omega+1)}\gamma\left(G_{2\omega\gamma}-G_{2\omega\gamma}^{(0)}\right)$$

$$\Delta G(x,Q^2) = \frac{2N_c}{\alpha_s\pi^2}\int\frac{d\omega}{2\pi i}\int\frac{d\gamma}{2\pi i}e^{\omega\ln\left(\frac{1}{x}\right)+\gamma\ln\left(\frac{Q^2}{\Lambda^2}\right)}G_{2\omega\gamma}$$

$$\Delta\Sigma(x,Q^2) = -\frac{N_f}{\alpha_s 2\pi^2}\int\frac{d\omega}{2\pi i}\int\frac{d\gamma}{2\pi i}\frac{\omega}{\omega-\gamma}\left(G_{2\omega\gamma}-G_{2\omega\gamma}^{(0)}\right)e^{\omega\ln\left(\frac{1}{x}\right)+\gamma\ln\left(\frac{Q^2}{\Lambda^2}\right)}$$

$$g_1(x,Q^2) = -\frac{1}{2}\sum_f Z_f^2\frac{1}{\alpha_s 2\pi^2}\int\frac{d\omega}{2\pi i}\int\frac{d\gamma}{2\pi i}\frac{\omega}{\omega-\gamma}\left(G_{2\omega\gamma}-G_{2\omega\gamma}^{(0)}\right)e^{\omega\ln\left(\frac{1}{x}\right)+\gamma\ln\left(\frac{Q^2}{\Lambda^2}\right)}$$

Resummed Anomalous Dimension

Now fix the initial conditions of the evolution to be simply

$$G_2^{(0)}(x_{10}^2, zs) = 1$$
$$G^{(0)}(x_{10}^2, zs) = 0$$

Gluon helicity PDF becomes:

$$\Delta G(x, Q^2) = \frac{2N_c}{\alpha_s \pi^2} \int \frac{d\omega}{2\pi i} e^{\omega \ln\left(\frac{1}{x}\right) + \gamma_\omega^- \ln\left(\frac{Q^2}{\Lambda^2}\right)} \frac{1}{\omega}$$

Pure-glue polarized anomalous dimension

$$\overline{\alpha}_s = \frac{\alpha_s N_c}{2\pi}$$

$$\Delta\gamma_{GG}(\omega) = \gamma_\omega^- = \frac{\omega}{2}\left[1 - \sqrt{1 - \frac{16\overline{\alpha}_s}{\omega^2}\sqrt{1 - \frac{4\overline{\alpha}_s}{\omega^2}}}\right] = \frac{4\overline{\alpha}_s}{\omega} + \frac{8\overline{\alpha}_s^2}{\omega^3} + \frac{56\overline{\alpha}_s^3}{\omega^5} + \frac{496\overline{\alpha}_s^4}{\omega^7} + \mathcal{O}(\alpha_s^5)$$

Agrees with fixed-order calculations up to $\mathcal{O}\left(\alpha_s^3\right)$

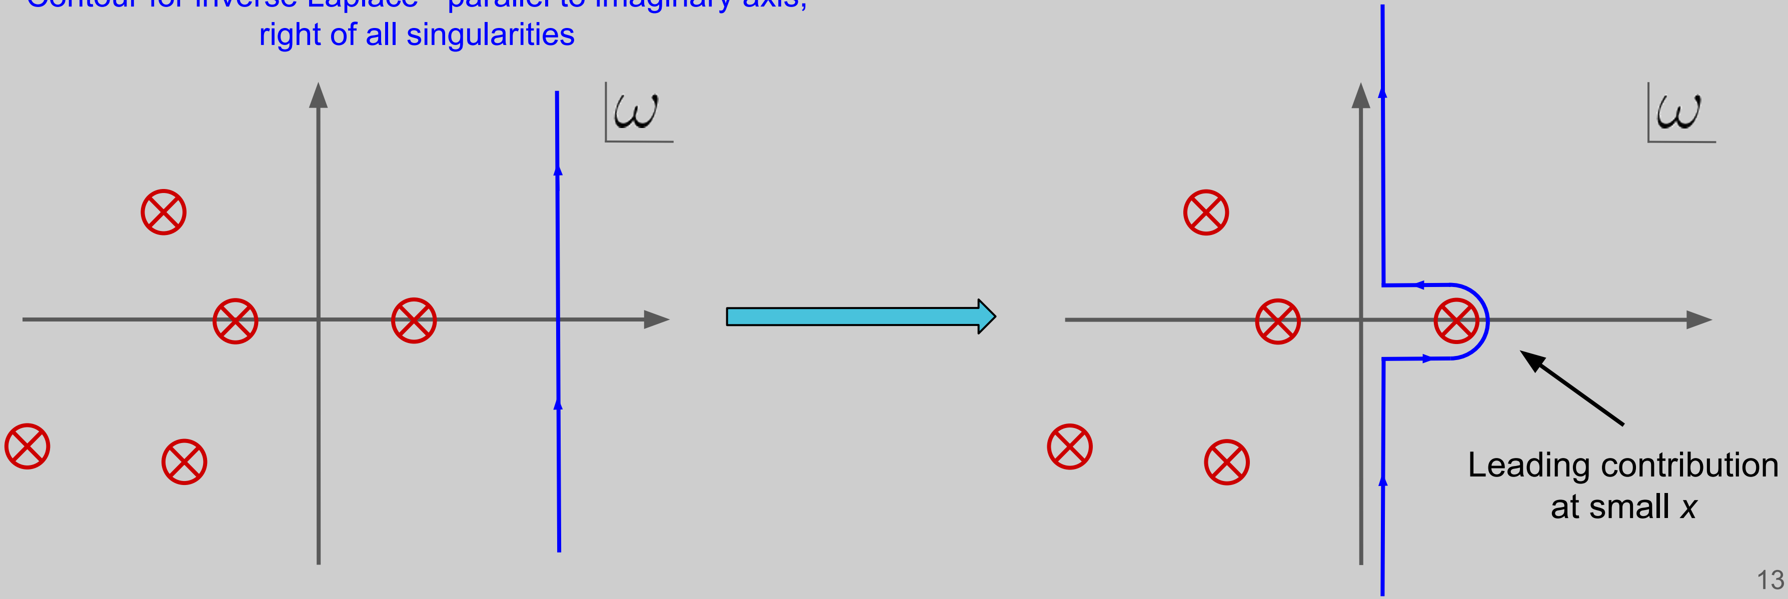
Small-x Asymptotics

Asymptotics governed by the intercept α_h $\Longrightarrow$ $\Delta\Sigma(x,Q^2) \sim \Delta G(x,Q^2) \sim g_1(x,Q^2) \sim \left(\frac{1}{x}\right)^{\alpha_h}$

corresponds to the rightmost singularity in the ω-plane

$$F(t) = \int \frac{d\omega}{2\pi i} e^{\omega t} f_\omega$$

Contour for inverse Laplace - parallel to imaginary axis, right of all singularities



Small-x Asymptotics

Rightmost singularity here comes from the polarized anomalous dimension $\Delta\gamma_{GG}(\omega) = \gamma_\omega^-$

See e.g. gluon helicity PDF $\Delta G(x, Q^2) = \frac{2N_c}{\alpha_s \pi^2} \int \frac{d\omega}{2\pi i} e^{\omega \ln\left(\frac{1}{x}\right) + \gamma_\omega^- \ln\left(\frac{Q^2}{\Lambda^2}\right)} \frac{1}{\omega}$

$$\gamma_\omega^- = \frac{\omega}{2}\left[1 - \sqrt{1 - \frac{16\bar{\alpha}_s}{\omega^2}\sqrt{1 - \frac{4\bar{\alpha}_s}{\omega^2}}}\right]$$

Branch point from the large square root

Takeaways

- Analytic solution at small-*x* and large-N_c for the dipole amplitudes
    - → Analytic expressions in the same regime for gluon and flavor-singlet quark helicity TMDs and PDFs, along with g_1
- Small-*x* asymptotics $\Delta\Sigma(x,Q^2) \sim \Delta G(x,Q^2) \sim g_1(x,Q^2) \sim \left(\frac{1}{x}\right)^{\alpha_h}$ $\alpha_h \approx 3.66074\sqrt{\frac{\alpha_s N_c}{2\pi}}$
    - A *very* small discrepancy compared to the prediction of BER: $\alpha_h^{\mathrm{BER}} \approx 3.66394\sqrt{\frac{\alpha_s N_c}{2\pi}}$
- Resummed small-*x* anomalous dimension

$$\Delta\gamma_{GG}(\omega) = \gamma_\omega^- = \frac{\omega}{2}\left[1 - \sqrt{1 - \frac{16\bar{\alpha}_s}{\omega^2}\sqrt{1 - \frac{4\bar{\alpha}_s}{\omega^2}}}\right] = \frac{4\bar{\alpha}_s}{\omega} + \frac{8\bar{\alpha}_s^2}{\omega^3} + \frac{56\bar{\alpha}_s^3}{\omega^5} + \frac{496\bar{\alpha}_s^4}{\omega^7} + \mathcal{O}(\alpha_s^5)$$

- Comparison with BER again yields a *very* small discrepancy, only at $\mathcal{O}(\alpha_s^4)$

$$\Delta\gamma_{GG}^{\mathrm{BER}}(\omega) = \frac{\omega}{2}\left[1 - \sqrt{1 - \frac{16\bar{\alpha}_s}{\omega^2}\frac{1-\frac{3\bar{\alpha}_s}{\omega^2}}{1-\frac{\bar{\alpha}_s}{\omega^2}}}\right] = \frac{4\bar{\alpha}_s}{\omega} + \frac{8\bar{\alpha}_s^2}{\omega^3} + \frac{56\bar{\alpha}_s^3}{\omega^5} + \frac{504\bar{\alpha}_s^4}{\omega^7} + \mathcal{O}(\alpha_s^5)$$

- **<u>All in all, very good agreement</u>**
- **Large- N_c & N_f limit next**

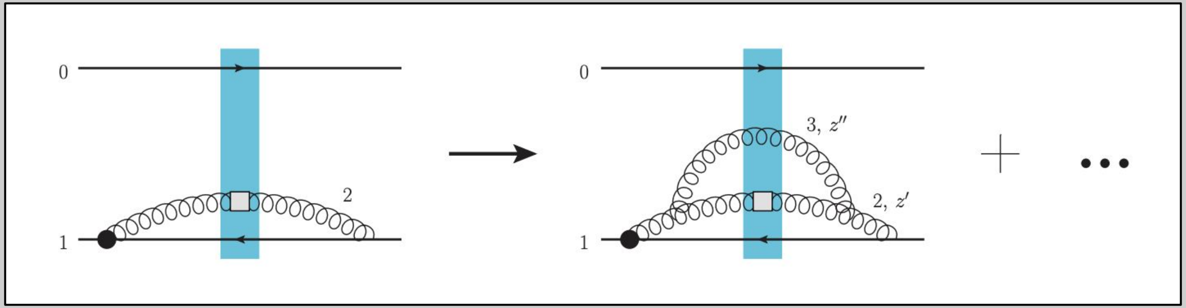
Neighbor Dipole Amplitudes



One step in evolution of neighbor dipole amplitude

(1) DLA lifetime ordering → $x_{21}^2 z' \gg x_{32}^2 z''$

(2) But also have IR cutoff for dipole 02 → $x_{32} \ll x_{20}$

When $x_{20}^2 > x_{21}^2 \frac{z'}{z''}$ → (1) is more constraining than (2)

So for everything to be ordered properly, subsequent evolution in dipole 02 (here evolving to give dipole 32) 'knows' about dipole 21

$$\frac{1}{2N_c}\left\langle\!\!\left\langle \mathrm{tr}\left[V_{\underline{0}}\,V_{\underline{1}}^{\mathrm{pol}[1]\,\dagger}\right]+\mathrm{c.c.}\right\rangle\!\!\right\rangle(zs)=\frac{1}{2N_c}\left\langle\!\!\left\langle \mathrm{tr}\left[V_{\underline{0}}\,V_{\underline{1}}^{\mathrm{pol}[1]\,\dagger}\right]+\mathrm{c.c.}\right\rangle\!\!\right\rangle_0(zs) \qquad G(x_{10}^2, zs)$$

Useful properties of the large-N_c equations

Scaling between $\mathbf{G_2}$ and $\mathbf{\Gamma}_2$

$$\Gamma_2(s_{10}, s_{21}, \eta') - G_2^{(0)}(s_{10}, \eta') = G_2(s_{10}, \eta = \eta' + s_{10} - s_{21}) - G_2^{(0)}(s_{10}, \eta = \eta' + s_{10} - s_{21})$$

Boundary conditions for neighbors

$$\Gamma_2(s_{10}, s_{21} = s_{10}, \eta) = G_2(s_{10}, \eta)$$
$$\Gamma(s_{10}, s_{21} = s_{10}, \eta) = G(s_{10}, \eta)$$

PDE for $\mathbf{\Gamma}$

$$\frac{\partial^2 \Gamma(s_{10}, s_{21}, \eta')}{\partial s_{21}^2} + \frac{\partial^2 \Gamma(s_{10}, s_{21}, \eta')}{\partial s_{21} \partial \eta'} + \Gamma(s_{10}, s_{21}, \eta') = -3G(s_{21}, \eta') - 2G_2(s_{21}, \eta') - 2\Gamma_2(s_{10}, s_{21}, \eta')$$

Note the rescaled variables

$$\eta = \sqrt{\overline{\alpha}_s} \ln \frac{zs}{\Lambda^2} \qquad \eta' = \sqrt{\overline{\alpha}_s} \ln \frac{z's}{\Lambda^2}$$

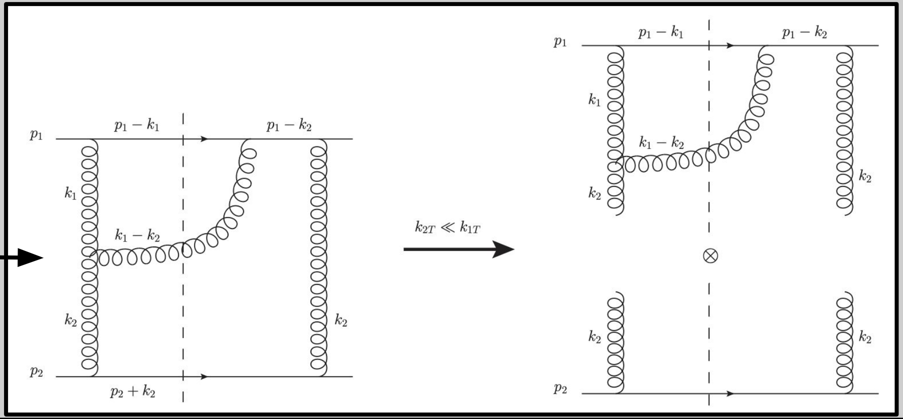
Disagreement with BER

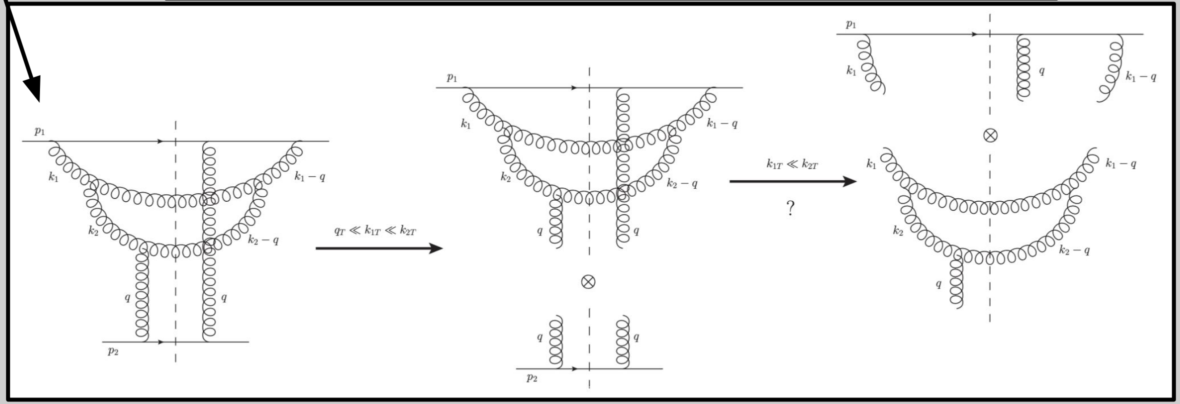
No hard non-ladder gluons in IREE

Two diagrams contained within KPS-CTT evolution



Ladder with rails k_1- k_2 & k_2 , (uncut) rung p_1- k_2 , and bremsstrahlung gluon k_1

Hard non-ladder gluon k_1 - k_2 accommodated at $\mathcal{O}(\alpha_s^3)$



3- and 5-point Green functions (BER IREE have only 4-point)

Problem at $\mathcal{O}(\alpha_s^4)$ (?)
