

Big Data and Computing at UConn

Cara Battersby, Assistant Professor of Physics

What is Big Data?

- **Large** (> terabytes - 10^{12} aka 2^{40} bytes), **complex** (can be structured or unstructured), **diverse** (different types) data.
- Data that has high enough volume (total amount), velocity (speed of reception and/or processing), and/or variety (different types and unstructured) that **traditional data storage and processing techniques are insufficient.**

What is Big Data?

- **Large** (> terabytes - 10^{12} aka 2^{40} bytes), **complex** (can be structured or unstructured), **diverse** (different types) data.
- Data that has high enough volume (total amount), velocity (speed of reception and/or processing), and/or variety (different types and unstructured) that **traditional data storage and processing techniques are insufficient.**
- A widely-used **umbrella term!**

5 Applications

- 5.1 Government
- 5.2 International development
 - 5.2.1 Benefits
 - 5.2.2 Challenges
- 5.3 Healthcare
- 5.4 Education
- 5.5 Media
- 5.6 Insurance
- 5.7 Internet of Things (IoT)
- 5.8 Information technology

6 Case studies

- 6.1 Government
 - 6.1.1 China
 - 6.1.2 India
 - 6.1.3 Israel
 - 6.1.4 United Kingdom
 - 6.1.5 United States
- 6.2 Retail
- 6.3 Science
- 6.4 Sports
- 6.5 Technology
- 6.6 COVID-19

Case Study: Modelling Hospital Demand

Flattening the Curve

Protect the Resources to Protect Us All

- China and Italy were the two hardest hit countries at the beginning of COVID-19
 - Both implemented early lockdowns
- Italy was running out of hospital beds and ventilators
 - Hospitals reported new arrivals every 5 minutes

Flattening the curve protects resources, but the allocation still has to work

Case Study: Modelling Hospital Demand

Patient Allocation Model

- Goals
 - Maximize utilization of hospital beds
 - Minimize patient travel
 - Minimize displacement of future patients
- Decisions
 - What hospital do we send a patient to?
 - What penalty do we incur for potentially displacing patients?
- Implementation
 - Python and Pyomo
 - Solvable with CBC, CPLEX, GLPK

$$\min \sum_j d_j x_j + \sum_{j,t} p_{jt}$$

$$\text{s.t.} \quad \sum_j x_j = 1 \quad \forall j$$

$$x_j \leq b_j x_j - o_j x_j - \sum_{t' \leq t} a_{jt'} x_j + \sum_{t' \leq t} d_{jt'} x_j + p_{jt} \quad \forall j, t$$

$$x_j \in \{0,1\}$$

$$p_{jt} \geq 0$$

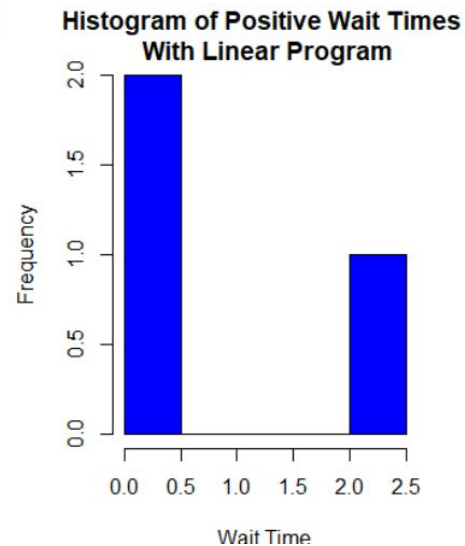

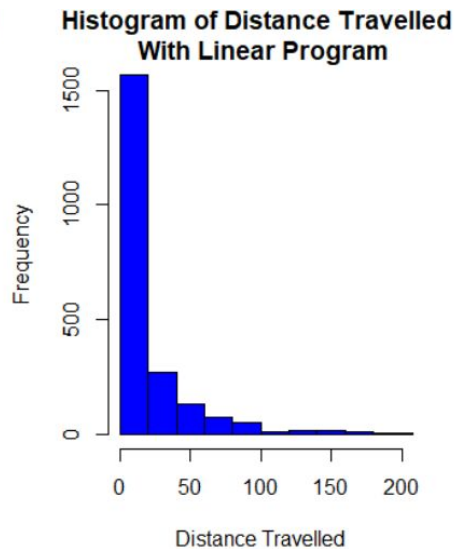

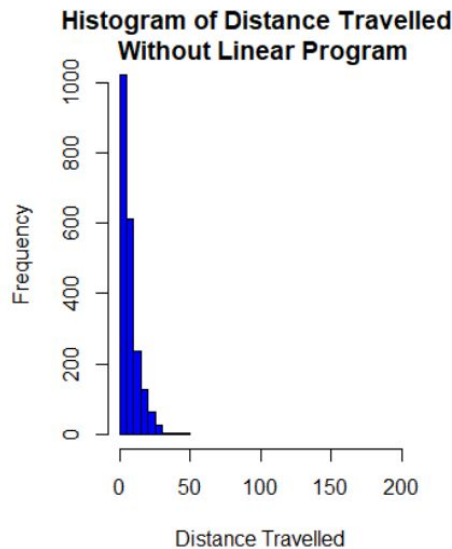

Case Study: Modelling Hospital Demand

How OSG Helped

- Monte Carlo simulation
 - Requires many runs
 - All runs are independent of each other
 - Perfect HTC problem
 - OSG made for HTC
- 1600 runs for each policy made
 - Run may take multiple hours
 - Just need to capture metrics
- Python worked well
 - Used virtualenv per OSG documentation
 - All required packages added to the venv
 - Added compiled copy of glpk to venv
 - Felt shady but necessary for Pyomo
 - CSV files with patient stats written
 - Logfiles via spdlog generated
 - Results turned to OSG submit node
 - Processed stats in R
 - Logs provided info to answer questions

Case Study: Modelling Hospital Demand

Capacity Computing for Data-Driven Science

- Can you think of any examples in your field?

Capacity Computing for Data-Driven Science

- Can you think of any examples in your field?
- Why might I need it?
 - It takes too long on my laptop!
 - The data won't fit “ “ “
 - I have other stuff to do “ “ “
 - Or, ***what more might I be able to do?*** Check more alternative ideas / models? Do more simulations to understand my data? Try out speculative ideas, just because I can?
- Where might I turn?
 - my research group or Department's dedicated resources
 - the Cloud
 - Central IT (HPC at UConn!) research computing resources
 - National HTC (Open Science Grid) or HPC resources for science

High Performance vs. Throughput Computing (HPC / HTC)

High Performance Computing (HPC):

- Problems that **can't be decomposed into small parts** (e.g. inverting a large matrix, lattice QCD)
- Problems that have **huge memory** and/or **cooperative scheduling** requirements
- Highly tuned complex problems. *Like a highly tuned Formula 1 car* -- built for a specific high performance task, but requires special skills to use.

High Throughput Computing (HTC):

- e.g. UConn's HPC cluster** <https://hpc.uconn.edu/> or the Open Science Grid, <https://opensciencegrid.org>
- HTC tasks **can be decomposed into small parts**, but need to be done many many times (e.g. analyzing millions of individual images).
- *Like 100,000 compact cars* -- don't need any special skills to use it, but has a large throughput.
- Most modern-day big data science problems require HTC.

Open Science Grid

** UConn's cluster is named an *HPC*, because it was when it was first developed 20 years ago, but now would be considered *HTC*.

High Performance vs. Throughput Computing (HPC / HTC)

High Performance Computing (HPC):

- Problems that **can't be decomposed into small parts** (e.g. inverting a large matrix, lattice QCD)
- Problems that have **huge memory** and/or **cooperative scheduling** requirements
- Highly tuned complex problems. **Like a highly tuned Formula 1 car** -- built for a specific high performance task, but requires special skills to use.

High Throughput Computing (HTC):

- e.g. **UConn's HPC cluster**** <https://hpc.uconn.edu/> or the **Open Science Grid**, <https://opensciencegrid.org>
- HTC tasks **can be decomposed into small parts**, but need to be done many many times (e.g. analyzing millions of individual images).
- **Like 100,000 compact cars** -- don't need any special skills to use it, but has a large throughput.
- Most modern-day big data science problems require HTC.

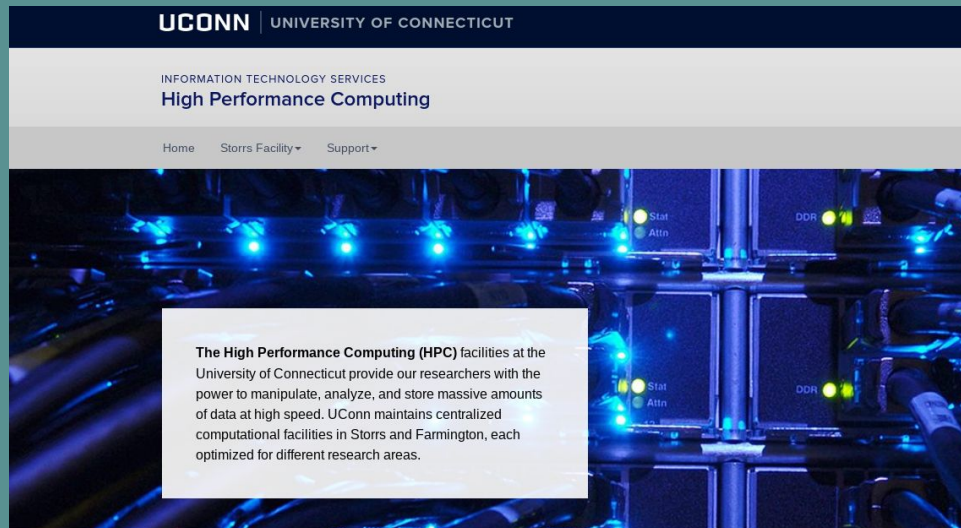

** UConn's cluster is named an **HPC**, because it was when it was first developed 20 years ago, but now would be considered **HTC**.

HPC Cluster - for smaller, flexible jobs

OSG - for bigger jobs

UConn's HPC Cluster

- <https://hpc.uconn.edu/>
- Anyone can make an account!
- No proposal required for jobs!
- Run locally!
- We will run a jupyter notebook on the cluster today

Instructions to access the HPC cluster

Jupyter Hub

<https://cn410.storrs.hpc.uconn.edu:48000/>

 jupyterhub **Untitled** Last Checkpoint: an hour ago (unsaved changes)

The Open Science Grid

- <https://opensciencegrid.org>
- **Anyone** (researchers at any US academic, government, or non-profit organization) can make an account! <https://www.osgconnect.net/> → **sign up!**
- **Free access to the Open Science Pool** via an OSG-supported access point, no proposal / allocation necessary
- **Includes:**
 - Initial consultation with an OSG research computing facilitator
 - Online documentation and examples
 - Access to OSG's central software modules
 - (roughly) unlimited scratch, space for staging large datasets and software, with cache across OSG

Open Science Grid

Submit locally, run globally.

US Researchers Can Use Open Science Pool, NOW!

Questions

Lauren Michael, lmichael@wisc.edu

Research Facilitation Lead (campuses and researchers), OSG

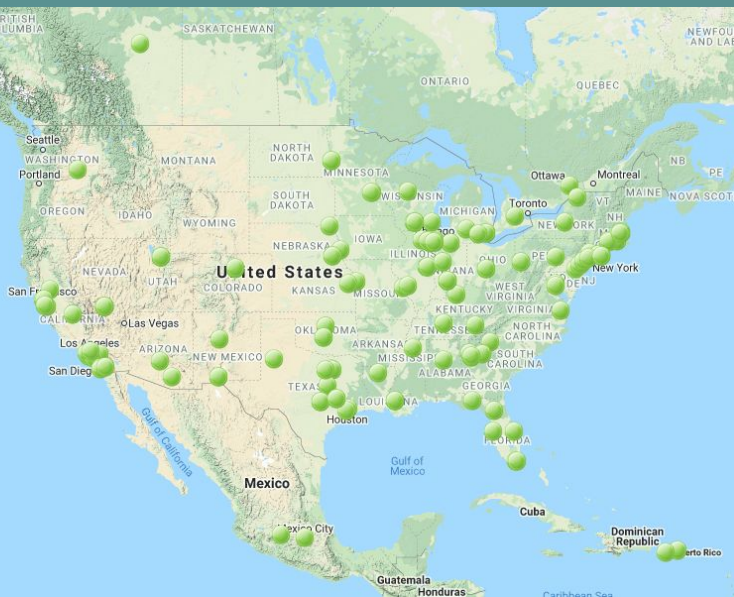

This work was partially supported by the NSF grants OAC-2030508, OAC-1841530, OAC-1836650, and MPS-1148698

The Open Science Grid

- NOT a replacement for traditional *HPC*
- most science problems do not require *HPC*, just a lot of time to run ordinary process over a larger volume of data or simulations -- *high-throughput computing*

Open Science Pool in 2020

Dark matter simulations

UConn and The Open Science Grid

- began at UConn Health
- at Storrs: 2009 US DOE grant (R. Jones, PI) to explore possibilities
 - formed “virtual organization” of users (Gluex)
 - set up UConn Storrs as “grid site” on OSG
 - outward-facing services (VOMS, CondorCE, StachCache, gFTP, xrootd)
 - accounting and reporting (Gratia, GRACC)
 - long-lived outgoing connections (hours)
- 2019 - NSF equipment grant (\$400k) for new OSG resource UConn-HTC
 - shared use model -- letter of support from UConn CIO
 - 38 new nodes housed in the data center (HPC racks)
 - different network requirements from existing HPC-Storrs cluster

<https://gracc.opensciencegrid.org>

Real World Example - Using the global seismic wavefield to understand Earth's interior

- Use 100,000 individual seismograms to **estimate the radius of Earth's core!**

From Harvey Mudd College Seismology:
<http://www.physics.hmc.edu/research/geo/seismo.html>

Real World Example - Using the global seismic wavefield to understand Earth's interior

Global Seismic Wavefield

- An **individual seismogram** records ground motion at a single location as a function of time. They are essential to detect the location and magnitude of earthquakes
- A global seismic wavefield incorporates these from across the globe and stacks them over time.

Example seismogram of an earthquake from the USGS (wikipedia) at 1 location with 3 components of motion (vertical (Z), north-south, and east-west).

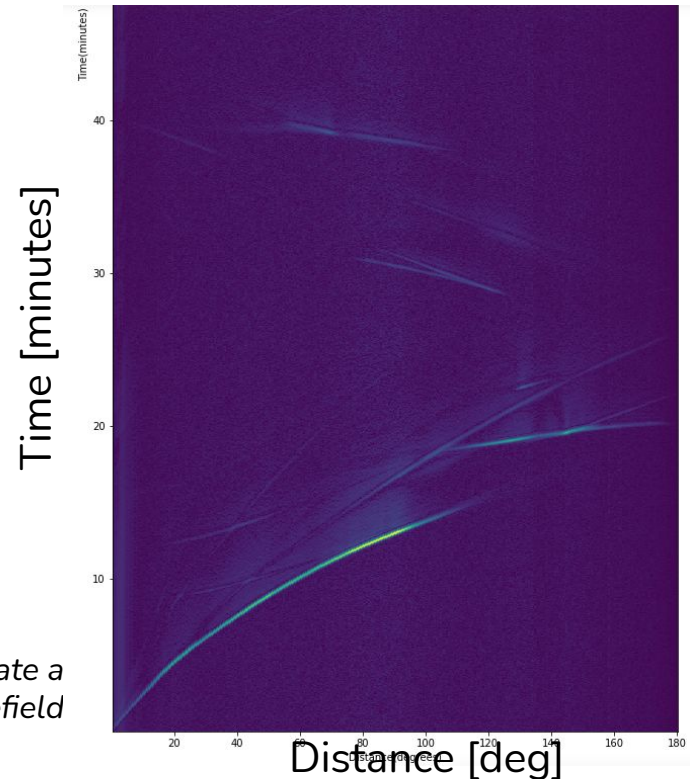

Real World Example - Using the global seismic wavefield to understand Earth's interior

Global Seismic Wavefield

- An individual seismogram records ground motion at a single location as a function of time. They are essential to detect the location and magnitude of earthquakes
- A **global seismic wavefield** incorporates these from across the globe and stacks them over time.

100,000 Stacked seismograms to create a global seismic wavefield

Real World Example - Using the global seismic wavefield to understand Earth's interior

The Data

- These data are from IRIS (Incorporated Research Institutions for Seismology) and comprise data from 1000s facilities over 29 years.
- Archive is now more than 700 Tebibytes (1 TiB = 1.1 TB, so 770 TB), aka HUGE!

Real World Example - Using the global seismic wavefield to understand Earth's interior

- We will compile the data from 100,000 unique seismograms, retrieved from the IRIS database to plot the **global seismic wavefield**
- This tells us about Earth's interior
- We will **estimate the radius of the Earth's core**

The screenshot shows a Jupyter Notebook interface. At the top, the header includes the Jupyter logo, the text 'jupyterhub PlotglobalstacksBasic', and 'Last Checkpoint: Yesterday at 12:39 PM (autosaved)'. On the right, there are buttons for 'Logout' and 'Control Panel'. Below the header is a menu bar with 'File', 'Edit', 'View', 'Insert', 'Cell', 'Kernel', and 'Help'. To the right of the menu bar are 'Not Trusted' and 'Python 3' indicators. Below the menu bar is a toolbar with icons for file operations, running, and markdown. The main content area has a title 'Introduction and Motivation' followed by a paragraph: 'We will use data of about 100,000 unique seismograms compiled from the IRIS database in order to plot the global seismic wavefield. These diagrams contain detailed information about the structure of Earth's interior. From this diagram, we will estimate the radius of Earth's core.' Below this is a section titled 'Here we are importing relevant python packages' with a note: 'To run a box you can click the "play" triangle button above or simply do "Shift + Enter"'. At the bottom, there is a code input box with the following code:

```
In [1]: import numpy as np
import matplotlib.pyplot as plt
```

Real World Example - Using the global seismic wavefield to understand Earth's interior

- Log in to jupyter hub with your netID: <https://cn410.storrs.hpc.uconn.edu:48000/>
- Follow along
- Work in groups of 2-3 (and ask questions!) to estimate the radius of Earth's core

The screenshot shows a JupyterLab interface. At the top, the title bar reads 'jupyterhub PlotglobalstacksBasic Last Checkpoint: Yesterday at 12:39 PM (autosaved)'. On the right, there are buttons for 'Logout' and 'Control Panel'. Below the title bar is a menu bar with 'File', 'Edit', 'View', 'Insert', 'Cell', 'Kernel', and 'Help'. To the right of the menu bar are 'Not Trusted' and 'Python 3' indicators. Below the menu bar is a toolbar with icons for file operations, running, and cell management. The main area displays a notebook with the following content:

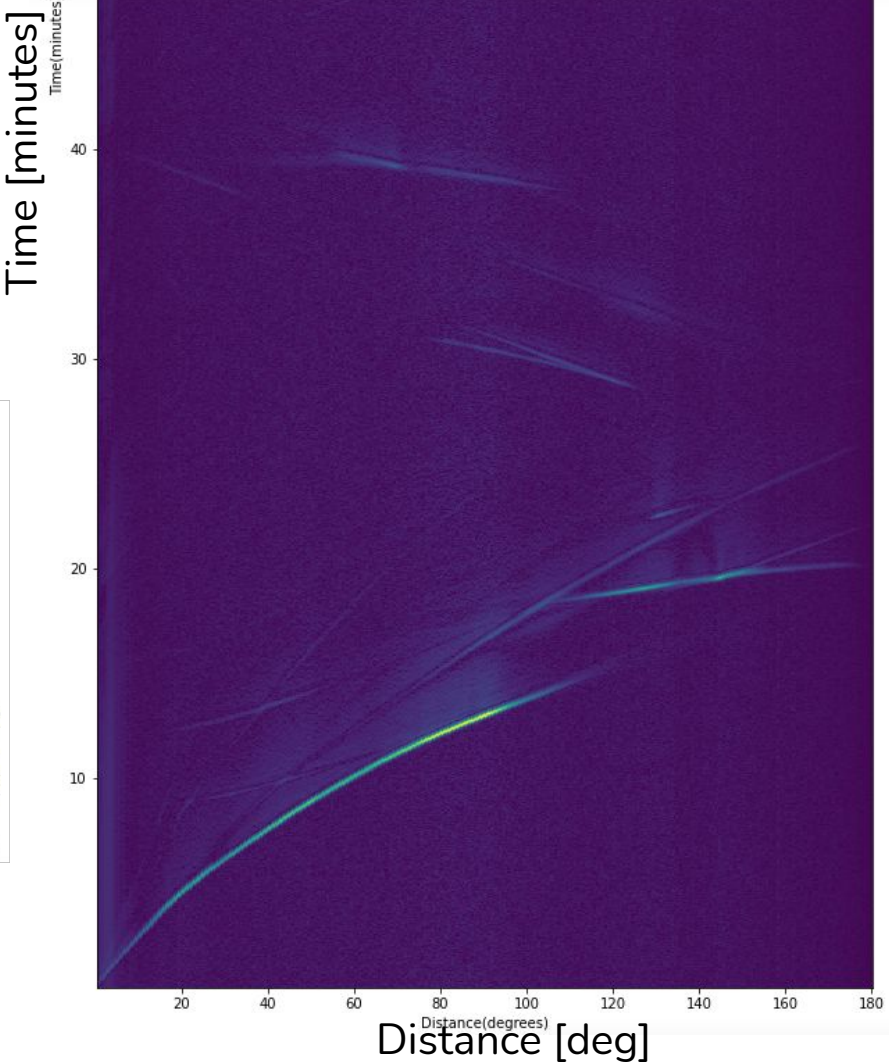

Introduction and Motivation

We will use data of about 100,000 unique seismograms compiled from the IRIS database in order to plot the global seismic wavefield. These diagrams contain detailed information about the structure of Earth's interior. From this diagram, we will estimate the radius of Earth's core.

Here we are importing relevant python packages
